

DLP230NP .23 1080p DMD

1 Features

- Ultra Compact 0.23-Inch (5.95-mm) Diagonal Micromirror Array
 - Displays 1920 × 1080 Pixels On the Screen
 - 5.4 μm Micromirror Pitch
 - 17° Micromirror Tilt (Relative to Flat Surface)
 - Side Illumination for Optimal Efficiency and Optical Engine Size
 - Polarization Independent Aluminum Micromirror Surface
- 8-Bit SubLVDS Input Data Bus
- Dedicated DLPC3436 Controller for Display Applications
- Dedicated DLPA2000, DLPA2005, or DLPA3000 PMIC/LED Driver for Reliable Operation

2 Display Applications

- [DLP Signage](#)
- [Mobile Projector](#)
- [Smart Speaker](#)
- [Virtual / Augmented Reality Headsets and Glasses](#)
- [Mobile Accessory](#)
- [Smart home displays](#)
- [Pico projectors](#)

3 Description

The **DLP230NP** digital micromirror device (DMD) is a digitally controlled micro-opto-electromechanical system (MOEMS) spatial light modulator (SLM). When coupled to an appropriate optical system, the DMD displays a crisp and high quality 1080p image or video. The chipset comprises this DMD and the [DLPC3436 controller](#). The [DLPA2000](#), [DLPA2005](#), and [DLPA3000](#) PMIC/LED drivers also support this chipset. The compact physical size of the device applies to portable equipment where high image quality, small form factor, and low power are important.

Visit the [Getting Started with TI DLP® Pico™ Display Technology](#) page to learn more about DMD technology.

The DMD device includes established resources to help the user accelerate the design cycle, which include [production ready optical modules](#), [optical modules manufacturers](#), and [design houses](#).

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
DLP230NP	FQP (54)	16.8 mm × 5.92 mm × 3.58 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

CONTROL INPUTS						
LS_WDATA	A12	I	LPSDR ⁽¹⁾	Single	Write data for low speed interface.	2.16

(1) Low speed interface is LPSDR and adheres to the Electrical Characteristics and AC/DC Operating Conditions table in JEDEC Standard No. 209B, *Low Power Double Data Rate (LPDDR)*. See [JESD209B](#).

(2) Net trace lengths inside the package:
Relative dielectric constant for the FQP ceramic package is 9.8.
Propagation speed = $11.8 / \sqrt{9.8} = 3.769$ in/ns.
Propagation delay = 0.265 ns/inch = 265 ps/in = 10.43 ps/mm.

Pin Functions – Connector Pins⁽¹⁾ (continued)

PIN		TYPE	SIGNAL	DATA RATE	DESCRIPTION	PACKAGE NET LENGTH ⁽²⁾ (mm)
NAME	NO.					
LS_CLK	B12	I	LPSDR	Single	Clock for low-speed interface.	3.38
DMD_DEN_ARSTZ	B14	I	LPSDR	Single	Asynchronous reset DMD signal. A low signal places the DMD in reset. A high signal releases the DMD from reset and places it in active mode.	0.67
DMD_DEN_ARSTZ	F1	I	LPSDR	Single		14.90
LS_RDATA	C13	O	LPSDR	Single	Read data for low-speed interface.	2.44
POWER						
V _{BIAS} ⁽³⁾	A15	Power			Supply voltage for positive bias level at micromirrors.	
V _{BIAS} ⁽³⁾	A5	Power				
V _{OFFSET} ⁽³⁾	F13	Power			Supply voltage for HVC MOS core logic. Supply voltage for stepped high level at micromirror address electrodes. Supply voltage for offset level at micromirrors.	
V _{OFFSET} ⁽³⁾	F4	Power				
V _{RESET}	B15	Power			Supply voltage for negative reset level at micromirrors.	
V _{RESET}	B5	Power				
V _{DD} ⁽³⁾	C15	Power			Supply voltage for LVCMOS core logic. Supply voltage for LPSDR inputs. Supply voltage for normal high level at micromirror address electrodes.	
V _{DD}	C5	Power				
V _{DD}	D14	Power				
V _{DD}	D15	Power				
V _{DD}	E14	Power				
V _{DD}	E15	Power				
V _{DD}	F14	Power				
V _{DD}	F15	Power				
V _{DDI}	C14	Power			Supply voltage for SubLVDS receivers.	
V _{DDI}	C4	Power				
V _{DDI}	D13	Power				
V _{DDI}	E13	Power				
V _{SS}	A13	Ground			Common return. Ground for all power.	
V _{SS}	A14	Ground				
V _{SS}	B13	Ground				
V _{SS}	B2	Ground				
V _{SS}	B3	Ground				
V _{SS}	C12	Ground				
V _{SS}	D1	Ground				
V _{SS}	D12	Ground				
V _{SS}	D2	Ground				
V _{SS}	E12	Ground				
V _{SS}	E3	Ground				
V _{SS}	E4	Ground				
V _{SS}	F12	Ground				

(3) The following power supplies are all required to operate the DMD: V_{DD}, V_{DDI}, V_{OFFSET}, V_{BIAS}, V_{RESET}. All V_{SS} connections are also required.

6 Specifications

6.1 Absolute Maximum Ratings

see ⁽¹⁾

			MIN	MAX	UNIT
Supply voltage	V _{DD}	Supply voltage for LVCMOS core logic ⁽²⁾ Supply voltage for LPSDR low speed interface	−0.5	2.3	V
	V _{DDI}	Supply voltage for SubLVDS receivers ⁽²⁾	−0.5	2.3	V
	V _{OFFSET}	Supply voltage for HVC MOS and micromirror electrode ^{(2) (3)}	−0.5	11	V
	V _{BIAS}	Supply voltage for micromirror electrode ⁽²⁾	−0.5	19	V
	V _{RESET}	Supply voltage for micromirror electrode ⁽²⁾	−15	0.5	V
	V _{DDI} −V _{DD}	Supply voltage delta (absolute value) ⁽⁴⁾		0.3	V
	V _{BIAS} −V _{OFFSET}	Supply voltage delta (absolute value) ⁽⁵⁾		11	V
	V _{BIAS} −V _{RESET}	Supply voltage delta (absolute value) ⁽⁶⁾		34	V
Input voltage	Input voltage for other inputs LPSDR ⁽²⁾		−0.5	V _{DD} + 0.5	V
	Input voltage for other inputs SubLVDS ^{(2) (7)}		−0.5	V _{DDI} + 0.5	V
Input pins	V _{ID}	SubLVDS input differential voltage (absolute value) ⁽⁷⁾		810	mV
	I _{ID}	SubLVDS input differential current		10	mA
Clock frequency	f _{clock}	Clock frequency for low speed interface LS_CLK		130	MHz
	f _{clock}	Clock frequency for high speed interface DCLK		620	MHz
Environmental	T _{ARRAY} and T _{WINDOW}	Temperature – operational ⁽⁸⁾	−20	90	°C
		Temperature – non-operational ⁽⁸⁾	−40	90	°C
	T _{DELTA}	Absolute temperature delta between any point on the window edge and the ceramic test point TP1 ⁽⁹⁾		30	°C
	T _{DP}	Dew Point - operating and non-operating		81	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device is not implied at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure above or below the *Recommended Operating Conditions* for extended periods may affect device reliability.
- (2) All voltage values are with respect to the ground terminals (V_{SS}). The following power supplies are all required to operate the DMD: V_{DD}, V_{DDI}, V_{OFFSET}, V_{BIAS}, and V_{RESET}. All V_{SS} connections are also required.
- (3) V_{OFFSET} supply transients must fall within specified voltages.
- (4) Exceeding the recommended allowable absolute voltage difference between V_{DDI} and V_{DD} may result in excessive current draw.
- (5) Exceeding the recommended allowable absolute voltage difference between V_{BIAS} and V_{OFFSET} may result in excessive current draw.
- (6) Exceeding the recommended allowable absolute voltage difference between V_{BIAS} and V_{RESET} may result in excessive current draw.
- (7) This maximum input voltage rating applies when each input of a differential pair is at the same voltage potential. Sub-LVDS differential inputs must not exceed the specified limit or damage may result to the internal termination resistors.
- (8) The highest temperature of the active array (as calculated by the *Micromirror Array Temperature Calculation*) or of any point along the window edge is defined in [Figure 18](#). The location of thermal test point TP2 in [Figure 18](#) is intended to measure the highest window edge temperature. If a particular application causes another point on the window edge to be at a higher temperature, that point should be used.
- (9) Temperature delta is the highest difference between the ceramic test point 1 (TP1) and anywhere on the window edge as shown in [Figure 18](#). The window test point TP2 shown in [Figure 18](#) is intended to result in the worst case delta. If a particular application causes another point on the window edge to result in a larger delta temperature, that point should be used.

6.2 Storage Conditions

Applicable for the DMD as a component or non-operating in a system.

		MIN	MAX	UNIT
T _{DMD}	DMD storage temperature	−40	85	°C
T _{DP}	Average dew point temperature (non-condensing) ⁽¹⁾		24	°C
T _{DP-ELR}	Elevated dew point temperature range (non-condensing) ⁽²⁾	28	36	°C
CT _{ELR}	Cumulative time in elevated dew point temperature range		6	months

- (1) The average over time (including storage and operating) that the device is not in the elevated dew point temperature range.
- (2) Exposure to dew point temperatures in the elevated range during storage and operation should be limited to less than a total cumulative time of CT_{ELR}.

6.3 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

6.4 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted)^{(1) (2)}

		MIN	NOM	MAX	UNIT
SUPPLY VOLTAGE RANGE⁽³⁾					
V_{DD}	Supply voltage for LVCMOS core logic Supply voltage for LPSDR low-speed interface	1.65	1.8	1.95	V
V_{DDI}	Supply voltage for SubLVDS receivers	1.65	1.8	1.95	V
V_{OFFSET}	Supply voltage for HVCMOS and micromirror electrode ⁽⁴⁾	9.5	10	10.5	V
V_{BIAS}	Supply voltage for mirror electrode	17.5	18	18.5	V
V_{RESET}	Supply voltage for micromirror electrode	–14.5	–14	–13.5	V
$ V_{DDI} - V_{DD} $	Supply voltage delta (absolute value) ⁽⁵⁾			0.3	V
$ V_{BIAS} - V_{OFFSET} $	Supply voltage delta (absolute value) ⁽⁶⁾			10.5	V
$ V_{BIAS} - V_{RESET} $	Supply voltage delta (absolute value) ⁽⁷⁾			33	V
CLOCK FREQUENCY					
f_{clock}	Clock frequency for low speed interface LS_CLK ⁽⁸⁾	108		120	MHz
f_{clock}	Clock frequency for high speed interface DCLK ⁽⁹⁾	300		540	MHz
	Duty cycle distortion DCLK	44%		56%	
SUBLVDS INTERFACE⁽⁹⁾					
$ V_{ID} $	SubLVDS input differential voltage (absolute value). See Figure 8 , Figure 9	150	250	350	mV
V_{CM}	Common mode voltage. See Figure 8 , Figure 9	700	900	1100	mV
$V_{SUBLVDS}$	SubLVDS voltage. See Figure 8 , Figure 9	575		1225	mV
Z_{LINE}	Line differential impedance (PWB/trace)	90	100	110	Ω
Z_{IN}	Internal differential termination resistance. See Figure 10	80	100	120	Ω
	100-Ω differential PCB trace	6.35		152.4	mm

- (1) The functional performance of the device specified in this data sheet is achieved when operating the device within the limits defined by the [Recommended Operating Conditions](#). No level of performance is implied when operating the device above or below the [Recommended Operating Conditions](#) limits.
- (2) The following power supplies are all required to operate the DMD: V_{DD} , V_{DDI} , V_{OFFSET} , V_{BIAS} , and V_{RESET} . All V_{SS} connections are also required.
- (3) All voltage values are with respect to the ground pins (V_{SS}).
- (4) V_{OFFSET} supply transients must fall within specified max voltages.
- (5) To prevent excess current, the supply voltage delta $|V_{DDI} - V_{DD}|$ must be less than the specified limit.
- (6) To prevent excess current, the supply voltage delta $|V_{BIAS} - V_{OFFSET}|$ must be less than the specified limit.
- (7) To prevent excess current, the supply voltage delta $|V_{BIAS} - V_{RESET}|$ must be less than the specified limit.
- (8) LS_CLK must run as specified to ensure internal DMD timing for reset waveform commands.
- (9) Refer to the SubLVDS timing requirements in [Timing Requirements](#).

Recommended Operating Conditions (continued)

Over operating free-air temperature range (unless otherwise noted)^{(1) (2)}

		MIN	NOM	MAX	UNIT
ENVIRONMENTAL					
T _{ARRAY}	Array temperature – long-term operational ^{(10) (11) (12) (13)}	0	40 to 70 ⁽¹²⁾		°C
	Array temperature – short-term operational, 25 hr max ^{(11) (14)}	–20		–10	°C
	Array temperature – short-term operational, 500 hr max ^{(11) (14)}	–10		0	°C
	Array temperature – short-term operational, 500 hr max ^{(11) (14)}	70		75	°C
T _{WINDOW}	Window temperature – operational ^{(15) (16)}			90	°C
T _{DELTA}	Absolute temperature delta between any point on the window edge and the ceramic test point TP1 ⁽¹⁷⁾			25	°C
T _{DP-AVG}	Average dew point temperature (non-condensing) ⁽¹⁸⁾			24	°C
T _{DP-ELR}	Elevated dew point temperature range (non-condensing) ⁽¹⁹⁾	28		36	°C
CT _{ELR}	Cumulative time in elevated dew point temperature range			6	months
ILL _{UV}	Illumination wavelengths < 420 nm ⁽¹⁰⁾			0.68	mW/cm ²
ILL _{VIS}	Illumination wavelengths between 420 nm and 700 nm			Thermally limited	
ILL _{IR}	Illumination wavelengths > 700 nm			10	mW/cm ²
ILL _θ	Illumination marginal ray angle ⁽¹⁵⁾			55	degrees

- (10) Simultaneous exposure of the DMD to the maximum *Recommended Operating Conditions* for temperature and UV illumination will reduce device lifetime.
- (11) The array temperature cannot be measured directly and must be computed analytically from the temperature measured at test point 1 (TP1) shown in [Figure 18](#) and the package thermal resistance using [Micromirror Array Temperature Calculation](#).
- (12) Per [Figure 1](#), the maximum operational array temperature should be derated based on the micromirror landed duty cycle that the DMD experiences in the end application. Refer to [Micromirror Landed-On/Landed-Off Duty Cycle](#) for a definition of micromirror landed duty cycle.
- (13) Long-term is defined as the usable life of the device.
- (14) Short-term is the total cumulative time over the useful life of the device.
- (15) The maximum marginal ray angle of the incoming illumination light at any point in the micromirror array, including at the pond of micromirrors (POM), should not exceed 55 degrees from the normal to the device array plane. The device window aperture has not necessarily been designed to allow incoming light at higher maximum angles to pass to the micromirrors, and the device performance has not been tested nor qualified at angles exceeding this. Illumination light exceeding this angle outside the micromirror array (including POM) will contribute to thermal limitations described in this document and may negatively affect lifetime.
- (16) Window temperature is the highest temperature on the window edge shown in [Figure 18](#). The location of thermal test point TP2 in [Figure 18](#) is intended to measure the highest window edge temperature. If a particular application causes another point on the window edge to be at a higher temperature, that point should be used.
- (17) Temperature delta is the highest difference between the ceramic test point 1 (TP1) and anywhere on the window edge shown in [Figure 18](#). The window test point TP2 shown in [Figure 18](#) is intended to result in the worst case delta temperature. If a particular application causes another point on the window edge to result in a larger delta temperature, that point should be used.
- (18) The average over time (including storage and operating) that the device is not in the 'elevated dew point temperature range'.
- (19) Exposure to dew point temperatures in the elevated range during storage and operation should be limited to less than a total cumulative time of CT_{ELR}.

Figure 1. Maximum Recommended Array Temperature – Derating Curve

6.5 Thermal Information

THERMAL METRIC ⁽¹⁾		DLP230NP	UNIT
		FQP (CLGA)	
		54 PINS	
Thermal resistance	Active area to test point 1 (TP1) ⁽¹⁾	9.0	°C/W

- (1) The DMD is designed to conduct absorbed and dissipated heat to the back of the package. The cooling system must be capable of maintaining the package within the temperature range specified in the [Recommended Operating Conditions](#). The total heat load on the DMD is largely driven by the incident light absorbed by the active area, although other contributions include light energy absorbed by the window aperture and electrical power dissipated by the array. Optical systems should be designed to minimize the light energy falling outside the window clear aperture since any additional thermal load in this area can significantly degrade the reliability of the device.

6.6 Electrical Characteristics

Over operating free-air temperature range (unless otherwise noted)⁽¹⁾

PARAMETER		TEST CONDITIONS ⁽²⁾	MIN	TYP	MAX	UNIT
CURRENT						
I _{DD}	Supply current: V _{DD} ^{(3) (4)}	V _{DD} = 1.95 V			120	mA
		V _{DD} = 1.8 V		105		
I _{DDI}	Supply current: V _{DDI} ^{(3) (4)}	V _{DDI} = 1.95 V			23	mA
		V _{DD} = 1.8 V		20		
I _{OFFSET}	Supply current: V _{OFFSET} ^{(5) (6)}	V _{OFFSET} = 10.5 V			3	mA
		V _{OFFSET} = 10 V		2.8		
I _{BIAS}	Supply current: V _{BIAS} ^{(5) (6)}	V _{BIAS} = 18.5 V			0.52	mA
		V _{BIAS} = 18 V		0.5		
I _{RESET}	Supply current: V _{RESET} ⁽⁶⁾	V _{RESET} = −14.5 V			−2.5	mA
		V _{RESET} = −14 V		−2.3		
POWER ⁽⁷⁾						
P _{DD}	Supply power dissipation: V _{DD} ^{(3) (4)}	V _{DD} = 1.95 V			234	mW
		V _{DD} = 1.8 V		189		
P _{DDI}	Supply power dissipation: V _{DDI} ^{(3) (4)}	V _{DDI} = 1.95 V			44.85	mW
		V _{DD} = 1.8 V		36		
P _{OFFSET}	Supply power dissipation: V _{OFFSET} ^{(5) (6)}	V _{OFFSET} = 10.5 V			31.5	mW
		V _{OFFSET} = 10 V		28		
P _{BIAS}	Supply power dissipation: V _{BIAS} ^{(5) (6)}	V _{BIAS} = 18.5 V			9.62	mW
		V _{BIAS} = 18 V		9		
P _{RESET}	Supply power dissipation: V _{RESET} ⁽⁶⁾	V _{RESET} = −14.5 V			36.25	mW
		V _{RESET} = −14 V		32.2		
P _{TOTAL}	Supply power dissipation: Total			294.2	356.22	mW
LPSDR INPUT ⁽⁸⁾						
V _{IH(DC)}	DC input high voltage ⁽⁹⁾		0.7 × V _{DD}		V _{DD} + 0.3	V
V _{IL(DC)}	DC input low voltage ⁽⁹⁾		−0.3		0.3 × V _{DD}	V
V _{IH(AC)}	AC input high voltage ⁽⁹⁾		0.8 × V _{DD}		V _{DD} + 0.3	V
V _{IL(AC)}	AC input low voltage ⁽⁹⁾		−0.3		0.2 × V _{DD}	V
ΔV _T	Hysteresis (V _{T+} − V _{T−})	Figure 10	0.1 × V _{DD}		0.4 × V _{DD}	V

- (1) Device electrical characteristics are over [Recommended Operating Conditions](#) unless otherwise noted.
(2) All voltage values are with respect to the ground pins (V_{SS}).
(3) To prevent excess current, the supply voltage delta $|V_{DDI} - V_{DD}|$ must be less than the specified limit.
(4) Supply power dissipation based on non-compressed commands and data.
(5) To prevent excess current, the supply voltage delta $|V_{BIAS} - V_{OFFSET}|$ must be less than the specified limit.
(6) Supply power dissipation based on 3 global resets in 200 μ s.
(7) The following power supplies are all required to operate the DMD: V_{DD} , V_{DDI} , V_{OFFSET} , V_{BIAS} , V_{RESET} . All V_{SS} connections are also required.
(8) LPSDR specifications are for pins LS_CLK and LS_WDATA.
(9) Low-speed interface is LPSDR and adheres to the Electrical Characteristics and AC/DC Operating Conditions table in JEDEC Standard No. 209B, *Low-Power Double Data Rate (LPDDR) JESD209B*.

Electrical Characteristics (continued)

Over operating free-air temperature range (unless otherwise noted)⁽¹⁾

PARAMETER		TEST CONDITIONS ⁽²⁾	MIN	TYP	MAX	UNIT
I_{IL}	Low-level input current	$V_{DD} = 1.95\text{ V}; V_I = 0\text{ V}$	-100			nA
I_{IH}	High-level input current	$V_{DD} = 1.95\text{ V}; V_I = 1.95\text{ V}$			100	nA
LPSDR OUTPUT⁽¹⁰⁾						
V_{OH}	DC output high voltage	$I_{OH} = -2\text{ mA}$	$0.8 \times V_{DD}$			V
V_{OL}	DC output low voltage	$I_{OL} = 2\text{ mA}$			$0.2 \times V_{DD}$	V
CAPACITANCE						
C_{IN}	Input capacitance LPSDR	$f = 1\text{ MHz}$			10	pF
	Input capacitance SubLVDS	$f = 1\text{ MHz}$			20	pF
C_{OUT}	Output capacitance	$f = 1\text{ MHz}$			10	pF
C_{RESET}	Reset group capacitance	$f = 1\text{ MHz}; (540 \times 120)\text{ micromirrors}$	90		150	pF

(10) LPSDR specification is for pin LS_RDATA.

6.7 Timing Requirements

Device electrical characteristics are over *Recommended Operating Conditions* unless otherwise noted.

			MIN	NOM	MAX	UNIT
LPSDR						
t_r	Rise slew rate ⁽¹⁾	$(30\% \text{ to } 80\%) \times V_{DD}$, Figure 3	1		3	V/ns

(1) Specification is for LS_CLK and LS_WDATA pins. Refer to LPSDR input rise slew rate and fall slew rate in [Figure 3](#).

(2) Specification is for DMD_DEN_ARSTZ pin. Refer to LPSDR input rise and fall slew rate in [Figure 3](#).

(3) Window time derating example: 0.5-V/ns slew rate increases the window time by 0.7 ns, from 3 to 3.7 ns.

(4) Specification is for SubLVDS receiver time only and does not take into account commanding and latency after commanding.

Low-speed interface is LPSDR and adheres to the [Electrical Characteristics](#) and AC/DC Operating Conditions table in JEDEC Standard No. 209B, *Low Power Double Data Rate (LPDDR)* JESD209B.

Figure 15. Micromirror Array Physical Characteristics

Figure 16. Mirror (Pixel) Pitch

6.11 Micromirror Array Optical Characteristics

PARAMETER	TEST CONDITIONS	MIN	NOM	MAX	UNIT
Micromirror tilt angle	DMD landed state ⁽¹⁾		17		degree
Micromirror tilt angle tolerance ^{(2) (3) (4) (5)}		–1.4		1.4	degree
Micromirror tilt direction ^{(6) (7)}	Landed ON state		180		degree
	Landed OFF state		270		
Micromirror crossover time ⁽⁸⁾	Typical performance		1	3	μs
Micromirror switching time ⁽⁹⁾	Typical performance	10			
Number of out-of-specification micromirrors ⁽¹⁰⁾	Adjacent micromirrors			0	micromirrors
	Non-adjacent micromirrors			10	

- (1) Measured relative to the plane formed by the overall micromirror array.
- (2) Additional variation exists between the micromirror array and the package datums.
- (3) Represents the landed tilt angle variation relative to the nominal landed tilt angle.
- (4) Represents the variation that can occur between any two individual micromirrors, located on the same device or located on different devices.
- (5) For some applications, it is critical to account for the micromirror tilt angle variation in the overall system optical design. With some system optical designs, the micromirror tilt angle variation within a device may result in perceivable non-uniformities in the light field reflected from the micromirror array. With some system optical designs, the micromirror tilt angle variation between devices may result in colorimetry variations, system efficiency variations, or system contrast variations.
- (6) When the micromirror array is landed (not parked), the tilt direction of each individual micromirror is dictated by the binary contents of the CMOS memory cell associated with each individual micromirror. A binary value of 1 results in a micromirror landing in the ON state direction. A binary value of 0 results in a micromirror landing in the OFF state direction.
- (7) Micromirror tilt direction is measured as in a typical polar coordinate system: Measuring counter-clockwise from a 0° reference which is aligned with the +X Cartesian axis.
- (8) The time required for a micromirror to nominally transition from one landed state to the opposite landed state.
- (9) The minimum time between successive transitions of a micromirror.
- (10) An out-of-specification micromirror is defined as a micromirror that is unable to transition between the two landed states within the specified micromirror switching time.

	Average over the wavelength range 420 to 680 nm. Applies to all angles 30° to 45° AOI.	97%			

(1) See [Optical Interface and System Image Quality Considerations](#) for more information.

(2) See the package mechanical characteristics for details regarding the size and location of the window aperture.

(3) The active area of the DLP230NP device is surrounded by an aperture on the inside of the DMD window surface that masks structures of the DMD device assembly from normal view. The aperture is sized to anticipate several optical conditions. Overfill light illuminating the area outside the active array can scatter and create adverse effects to the performance of an end application using the DMD. The illumination optical system should be designed to limit light flux incident outside the active array to less than 10% of the average flux level in the active area. Depending on the particular system's optical architecture and assembly tolerances, the amount of overfill light on the outside of the active array may cause system performance degradation.

6.13 Chipset Component Usage Specification

NOTE

TI assumes no responsibility for image quality artifacts or DMD failures caused by optical system operating conditions exceeding limits described previously.

The DLP230NP is a component of one or more DLP[®] chipsets. Reliable function and operation of the DLP230NP requires that it be used in conjunction with the other components of the applicable DLP chipset, including those components that contain or implement TI DMD control technology. TI DMD control technology consists of the TI technology and devices used for operating or controlling a DLP DMD.

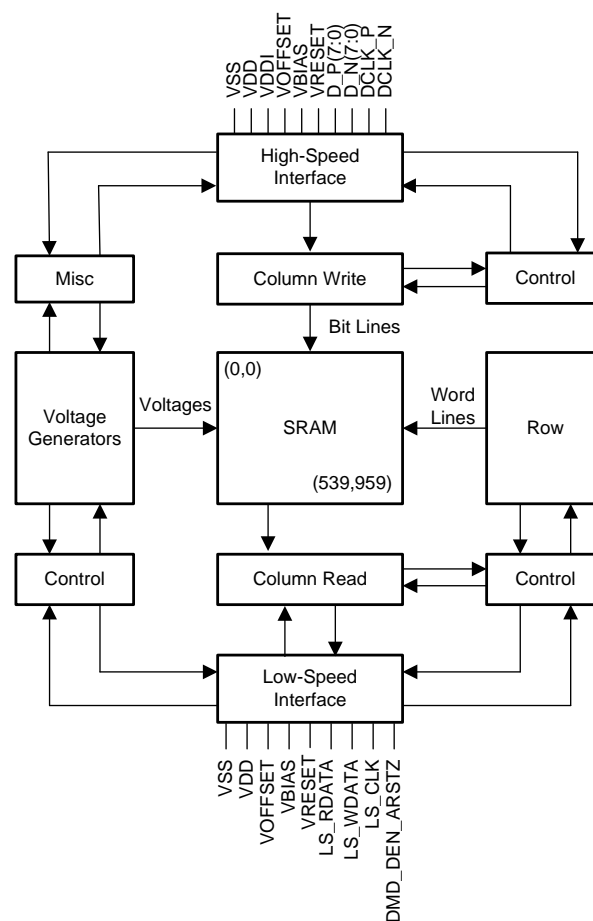

7 Detailed Description

7.1 Overview

The DLP230NP is a 0.23-inch diagonal spatial light modulator of aluminum micromirrors. Micromirror array size is 960 columns by 540 rows in a square micromirror arrangement. The fast switching speed of the DMD micromirrors combined with advanced DLP image processing algorithms enables each micromirror to display 4 distinct pixels on the screen during every frame, resulting in a full 1920 x 1080 pixel image being displayed. The electrical interface is sub low voltage differential signaling (SubLVDS) data.

The DLP230NP is part of the chipset comprised of the DMD, the DLPC3436CZVB display controller, and the DLPA2000/2005/3000 PMIC/LED driver. To ensure reliable operation, this DMD must always be used with the DLPC3436CZVB display controller and the DLPA2000/2005/3000 PMIC/LED drivers.

7.2 Functional Block Diagram

(1) Details omitted for clarity.

7.3 Feature Description

7.3.1 Power Interface

The power management IC DLPA2000/2005/3000 contains three regulated DC supplies for the DMD reset circuitry: V_{BIAS} , V_{RESET} and V_{OFFSET} , as well as the two regulated DC supplies for the DLPC3436CZVB controller.

7.3.2 Low-Speed Interface

The low speed interface handles instructions that configure the DMD and control reset operation. LS_CLK is the low-speed clock, and LS_WDATA is the low speed data input.

7.3.3 High-Speed Interface

The purpose of the high-speed interface is to transfer pixel data rapidly and efficiently, making use of high speed DDR transfer and compression techniques to save power and time. The high-speed interface is composed of differential SubLVDS receivers for inputs with a dedicated clock.

7.3.4 Timing

The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. [Figure 13](#) shows an equivalent test load circuit for the output under test. Timing reference loads are not intended as a precise representation of any particular system environment or depiction of the actual load presented by a production test. System designers should use IBIS or other simulation tools to correlate the timing reference load to a system environment. The load capacitance value stated is only for characterization and measurement of AC timing signals. This load capacitance value does not indicate the maximum load the device is capable of driving.

7.4 Device Functional Modes

DMD functional modes are controlled by the DLPC3436CZVB controller. See the DLPC3436CZVB controller data sheet or contact a TI applications engineer.

7.5 Optical Interface and System Image Quality Considerations

TI assumes no responsibility for end-equipment optical performance. Achieving the desired end-equipment optical performance involves making trade-offs between numerous component and system design parameters. Optimizing system optical performance and image quality strongly relate to optical system design parameter trades. Although it is not possible to anticipate every conceivable application, projector image quality and optical performance is contingent on compliance to the optical system operating conditions described in the following sections.

7.5.1 Numerical Aperture and Stray Light Control

The angle defined by the numerical aperture of the illumination and projection optics at the DMD optical area should be the same. This angle should not exceed the nominal device mirror tilt angle unless appropriate apertures are added in the illumination and/or projection pupils to block out flat-state and stray light from the projection lens. The mirror tilt angle defines DMD capability to separate the ON optical path from any other light path, including undesirable flat-state specular reflections from the DMD window, DMD border structures, or other system surfaces near the DMD such as prism or lens surfaces. If the numerical aperture exceeds the mirror tilt angle, or if the projection numerical aperture angle is more than two degrees larger than the illumination numerical aperture angle, objectionable artifacts in the display's border and/or active area could occur.

7.5.2 Pupil Match

TI's optical and image quality specifications assume that the exit pupil of the illumination optics is nominally centered within 2° of the entrance pupil of the projection optics. Misalignment of pupils can create objectionable artifacts in the display's border and/or active area, which may require additional system apertures to control, especially if the numerical aperture of the system exceeds the pixel tilt angle.

Optical Interface and System Image Quality Considerations (continued)

7.5.3 Illumination Overfill

The active area of the device is surrounded by an aperture on the inside DMD window surface that masks structures of the DMD chip assembly from normal view and is sized to anticipate several optical operating conditions. Overfill light illuminating the window aperture can create artifacts from the edge of the window aperture opening and other surface anomalies that may be visible on the screen. The illumination optical system should be designed to limit light flux incident anywhere on the window aperture from exceeding approximately 10% of the average flux level in the active area. Depending on the particular system's optical architecture, overfill light may have to be further reduced below the suggested 10% level in order to be acceptable.

7.6 Micromirror Array Temperature Calculation

Figure 18. DMD Thermal Test Points

Micromirror array temperature cannot be measured directly, therefore it must be computed analytically from measurement points on the outside of the package, the package thermal resistance, the electrical power, and the illumination heat load. The relationship between array temperature and the reference ceramic temperature (thermal test point TP1 in [Figure 18](#)) is provided by the following equations:

$$T_{\text{ARRAY}} = T_{\text{CERAMIC}} + (Q_{\text{ARRAY}} \times R_{\text{ARRAY-TO-CERAMIC}})$$

$$Q_{\text{ARRAY}} = Q_{\text{ELECTRICAL}} + Q_{\text{ILLUMINATION}}$$

$$Q_{\text{ILLUMINATION}} = (C_{\text{L2W}} \times \text{SL})$$

where

Micromirror Array Temperature Calculation (continued)

- T_{ARRAY} = Computed DMD array temperature ($^{\circ}\text{C}$)
- T_{CERAMIC} = Measured ceramic temperature ($^{\circ}\text{C}$), TP1 location in [Figure 18](#)
- $R_{\text{ARRAY-TO-CERAMIC}}$ = Thermal resistance from array to TP1 on ceramic ($^{\circ}\text{C}/\text{W}$) specified in [Thermal Information](#)
- Q_{ARRAY} = Total (electrical + absorbed) DMD power on array (W)
- $Q_{\text{ELECTRICAL}}$ = Nominal DMD electrical power dissipation (W)
- C_{L2W} = Conversion constant for screen lumens to absorbed optical power on the DMD (W/lm) specified below
- SL = Measured ANSI screen lumens (lm)

Electrical power dissipation of the DMD is variable and depends on the voltages, data rates, and operating frequencies. Nominal electrical power dissipation to use when calculating array temperature is 0.23 W. Absorbed optical power from the illumination source is variable and depends on the operating state of the micromirrors and the intensity of the light source. Equations shown above are valid for a 1-chip DMD system with total projection efficiency through the projection lens from DMD to the screen of 87%.

The conversion constant C_{L2W} is based on the DMD micromirror array characteristics. It assumes a spectral efficiency of 300 lm/W for the projected light and illumination distribution of 83.7% on the DMD active array, and 16.3% on the DMD array border and window aperture. The conversion constant is calculated to be 0.00266 W/lm.

Sample calculations for typical projection application:

$$T_{\text{CERAMIC}} = 55^{\circ}\text{C} \text{ (measured)}$$

$$SL = 200 \text{ lm (measured)}$$

$$Q_{\text{ELECTRICAL}} = 0.23 \text{ W}$$

$$C_{\text{L2W}} = 0.00266 \text{ W/lm}$$

$$Q_{\text{ARRAY}} = 0.23 \text{ W} + (0.00266 \text{ W/lm} \times 200 \text{ lm}) = 0.762 \text{ W}$$

$$T_{\text{ARRAY}} = 55^{\circ}\text{C} + (0.762 \text{ W} \times 9^{\circ}\text{C/W}) = 61.86^{\circ}\text{C}$$

7.7 Micromirror Landed-On/Landed-Off Duty Cycle

7.7.1 Definition of Micromirror Landed-On/Landed-Off Duty Cycle

The micromirror landed-on/landed-off duty cycle (landed duty cycle) denotes the amount of time (as a percentage) that an individual micromirror is landed in the ON state versus the amount of time the same micromirror is landed in the OFF state.

As an example, a landed duty cycle of 75/25 indicates that the referenced pixel is in the ON state 75% of the time and in the OFF state 25% of the time, whereas 25/75 would indicate that the pixel is in the ON state 25% of the time. Likewise, 50/50 indicates that the pixel is ON 50% of the time and OFF 50% of the time.

Note that when assessing landed duty cycle, the time spent switching from one state (ON or OFF) to the other state (OFF or ON) is considered negligible and is thus ignored.

Since a micromirror can only be landed in one state or the other (ON or OFF), the two numbers (percentages) nominally add to 100.

7.7.2 Landed Duty Cycle and Useful Life of the DMD

Knowing the long-term average landed duty cycle (of the end product or application) is important because subjecting all (or a portion) of the DMD's micromirror array to an asymmetric landed duty cycle for a prolonged period of time can reduce the DMD's usable life.

Note that it is the symmetry/asymmetry of the landed duty cycle that is of relevance. The symmetry of the landed duty cycle is determined by how close the two numbers (percentages) are to being equal. For example, a landed duty cycle of 50/50 is perfectly symmetrical whereas a landed duty cycle of 100/0 or 0/100 is perfectly asymmetrical.

Micromirror Landed-On/Landed-Off Duty Cycle (continued)

7.7.3 Landed Duty Cycle and Operational DMD Temperature

Operational DMD temperature and landed duty cycle interact to affect the DMD's usable life. This is quantified in the de-rating curve shown in [Figure 1](#). The importance of this curve is that:

- All points along this curve represent the same usable life.
- All points above this curve represent lower usable life (and the further away from the curve, the lower the usable life).
- All points below this curve represent higher usable life (and the further away from the curve, the higher the usable life).

In practice, this curve specifies the maximum operating DMD temperature that the DMD should be operated at for a given long-term average landed duty cycle.

7.7.4 Estimating the Long-Term Average Landed Duty Cycle of a Product or Application

During a given period of time, the nominal landed duty cycle of a given pixel is determined by the image content being displayed by that pixel.

For example, in the simplest case, when displaying pure-white on a given pixel for a given time period, that pixel will experience very close to a 100/0 landed duty cycle during that time period. Likewise, when displaying pure-black, the pixel will experience very close to a 0/100 landed duty cycle.

Between the two extremes (ignoring for the moment color and any image processing that may be applied to an incoming image), the landed duty cycle tracks one-to-one with the gray scale value, as shown in [Table 1](#).

Table 1. Grayscale Value and Landed Duty Cycle

Grayscale Value	Nominal Landed Duty Cycle
0%	0/100
10%	10/90
20%	20/80
30%	30/70
40%	40/60
50%	50/50
60%	60/40
70%	70/30
80%	80/20
90%	90/10
100%	100/0

Accounting for color rendition (but still ignoring image processing) requires knowing both the color scale value (from 0% to 100%) for each constituent primary color (red, green, and/or blue) for the given pixel as well as the color cycle time for each primary color, where "color cycle time" is the total percentage of the frame time that a given primary must be displayed in order to achieve the desired white point.

During a given period of time, the nominal landed duty cycle of a given pixel can be calculated as follows:

$$\text{Landed Duty Cycle} = (\text{Red_Cycle_}\% \times \text{Red_Scale_Value}) + (\text{Green_Cycle_}\% \times \text{Green_Scale_Value}) + (\text{Blue_Cycle_}\% \times \text{Blue_Scale_Value})$$

where

Red_Cycle_%, Green_Cycle_%, and Blue_Cycle_% represent the percentage of the frame time that red, green, and blue are displayed (respectively) to achieve the desired white point. (1)

For example, assuming that the red, green and blue color cycle times are 50%, 20%, and 30% respectively (in order to achieve the desired white point), then the nominal landed duty cycle for various combinations of red, green, blue color intensities would be as shown in [Table 2](#).

Table 2. Example Landed Duty Cycle for Full-Color Pixels

Red Cycle Percentage	Green Cycle Percentage	Blue Cycle Percentage
50%	20%	30%

Red Scale Value	Green Scale Value	Blue Scale Value	Nominal Landed Duty Cycle
0%	0%	0%	0/100
100%	0%	0%	50/50
0%	100%	0%	20/80
0%	0%	100%	30/70
12%	0%	0%	6/94
0%	35%	0%	7/93
0%	0%	60%	18/82
100%	100%	0%	70/30
0%	100%	100%	50/50
100%	0%	100%	80/20
12%	35%	0%	13/87
0%	35%	60%	25/75
12%	0%	60%	24/76
100%	100%	100%	100/0

The last factor to account for in estimating the landed duty cycle is any applied image processing. Within the DLP controller DLPC3436CZVB, the three functions which influence the actual landed duty cycle are gamma, IntelliBright™, and bitplane sequencing rules.

Gamma is a power function of the form $\text{Output_Level} = A \times \text{Input_Level}^{\text{Gamma}}$, where A is a scaling factor that is typically set to 1.

In the DLPC3436CZVB controller, gamma is applied to the incoming image data on a pixel-by-pixel basis. A typical gamma factor is 2.2, which transforms the incoming data as shown in [Figure 19](#).

Figure 19. Example of Gamma = 2.2

For example, from [Figure 19](#), if the gray scale value of a given input pixel is 40% (before gamma is applied), then the gray scale value will be 13% after gamma is applied. Therefore, it can be seen that since gamma has a direct impact displayed gray scale level of a pixel, it also has a direct impact on the landed duty cycle of a pixel.

The IntelliBright algorithm's content adaptive illumination control (CAIC) and local area brightness boost (LABB) also apply transform functions on the gray scale level of each pixel.

But while the amount of gamma applied to every pixel of every frame is constant (the exponent, gamma, is constant), CAIC and LABB are both adaptive functions that can apply different amounts of either boost or compression to every pixel of every frame.

Consideration must also be given to any image processing which occurs before the DLPC3436CZVB controller.

8 Application and Implementation

NOTE

Information in the following application sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

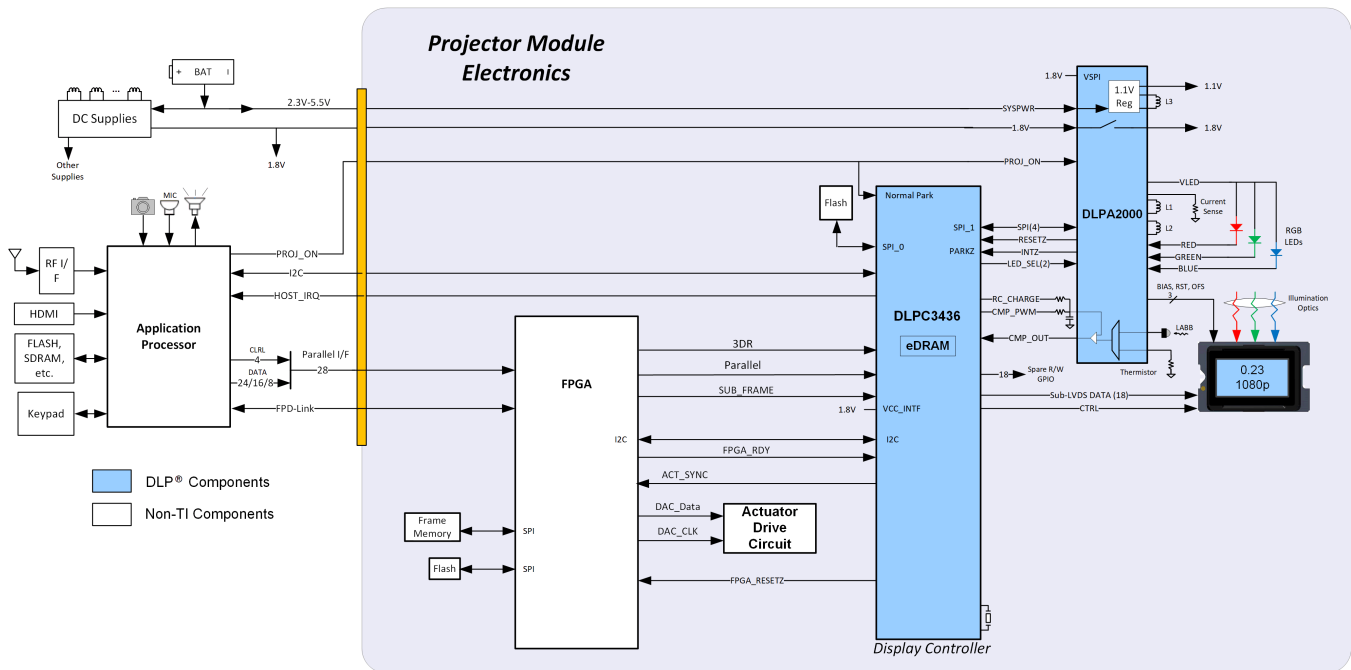

The DMDs are spatial light modulators which reflect incoming light from an illumination source to one of two directions, with the primary direction being into a projection or collection optic. Each application is derived primarily from the optical architecture of the system and the format of the data coming into the DLPC3436 controller. The new high tilt pixel in the side-illuminated DMD increases brightness performance and enables a smaller system footprint for thickness-constrained applications. Applications of interest include projection technology embedded in display devices like ultra low-power battery operated mobile accessory projectors, phones, tablets, ultra mobile low end Smart TVs, and virtual assistants.

DMD power-up and power-down sequencing is strictly controlled by the DLPA2000/2005/3000. Refer to [Power Supply Recommendations](#) for power-up and power-down specifications. To ensure reliable operation, the DLP230NP DMD must always be used with the DLPC3436 display controller and a DLPA2000/2005/3000 PMIC/LED driver.

8.2 Typical Application

A common application when using DLPC3436 controller with DLP230NP (.23 1080p), a XC7Z020-1CLG484I4493 FPGA, and DLPAA2000 PMIC/LED driver is for creating a Pico projector embedded in a handheld product. For example, a Pico projector may be embedded in a smart phone, a tablet, a camera, or camcorder. The FPGA in the Pico projector embedded module typically receives images from a host processor within the product.

Typical Application Diagram

8.2.1 Design Requirements

A pico projector is created by using a DLP chipset comprised of a DLP230NP (.23 1080p) DMD, a DLPC3436 controller, a XC7Z020-1CLG484I4493 FPGA, and DLPxxxx PMIC/LED driver. The controller and FPGA do the digital image processing, the DLPxxxx provides the needed analog functions for the projector, and the the DMD is the display device for producing the projected image.

In addition to the three DLP chips in the chipset, other chips are needed. At a minimum a flash part is needed to store the controller software. In addition, a flash part is needed to store the FPGA program.

The illumination light that is applied to the DMD is typically from red, green, and blue LEDs. These are often contained in three separate packages, but sometimes more than one color of LED die may be in the same package to reduce the overall size of the pico projector.

The entire pico-projector can be turned on and off by using a single signal called PROJ_ON. When PROJ_ON is high, the projector turns on and begins displaying images. When PROJ_ON is set low, the projector turns off and draws just microamps of current on SYSPWR. When PROJ_ON is set low, the 1.8-V supply can continue to be left at 1.8 V and used by other non-projector sections of the product. If PROJ_ON is low, the DLPxxxx does not draw current on the 1.8-V supply.

Typical Application (continued)

8.2.2 Detailed Design Procedure

For connecting together the DLPC3436 controller, the DLPxxxx PMIC/LED Driver, XC7Z020-1CLG484|4493 FPGA, and the DLP230NP (.23 1080p) DMD, see the reference design schematic. When a circuit board layout is created from this schematic a very small circuit board is possible.

The optical engine that has the LED packages and the DMD mounted to it is typically supplied by an optical OEM who specializes in designing optics for DLP projectors.

8.2.3 Application Curve

As the LED currents that are driven time-sequentially through the red, green, and blue LEDs are increased, the brightness of the projector increases. This increase is somewhat non-linear, and the curve for typical white screen lumens changes with LED currents is as shown in Figure 20. For the LED currents shown, it is assumed that the same current amplitude is applied to the red, green, and blue LEDs.

Figure 20. Luminance vs Current

D001

9 Power Supply Recommendations

The following power supplies are all required to operate the DMD: V_{DD} , V_{DDI} , V_{OFFSET} , V_{BIAS} , and V_{RESET} . All V_{SS} connections are also required. DMD power-up and power-down sequencing is strictly controlled by the DLPA2000/2005/3000 devices.

CAUTION

For reliable operation of the DMD, the following power supply sequencing requirements must be followed. Failure to adhere to the prescribed power-up and power-down procedures may affect device reliability.

V_{DD} , V_{DDI} , V_{OFFSET} , V_{BIAS} , and V_{RESET} power supplies have to be coordinated during power-up and power-down operations. Failure to meet any of the below requirements will result in a significant reduction in the DMD's reliability and lifetime. Refer to [Figure 22](#). V_{SS} must also be connected.

9.1 Power Supply Power-Up Procedure

- During power-up, V_{DD} and V_{DDI} must always start and settle before V_{OFFSET} , V_{BIAS} , and V_{RESET} voltages are applied to the DMD.
- During power-up, it is a strict requirement that the delta between V_{BIAS} and V_{OFFSET} must be within the specified limit shown in [Recommended Operating Conditions](#). Refer to [Figure 22](#) for power-up delay requirements.
- During power-up, the DMD's LPSDR input pins shall not be driven high until after V_{DD} and V_{DDI} have settled at operating voltage.
- During power-up, there is no requirement for the relative timing of V_{RESET} with respect to V_{OFFSET} and V_{BIAS} . Power supply slew rates during power-up are flexible, provided that the transient voltage levels follow the requirements listed previously and in [Figure 21](#).

9.2 Power Supply Power-Down Procedure

- The power-down sequence is the reverse order of the previous power-up sequence. V_{DD} and V_{DDI} must be supplied until after V_{BIAS} , V_{RESET} , and V_{OFFSET} are discharged to within 4 V of ground.
- During power-down, it is not mandatory to stop driving V_{BIAS} prior to V_{OFFSET} , but it is a strict requirement that the delta between V_{BIAS} and V_{OFFSET} must be within the specified limit shown in [Recommended Operating Conditions](#) (Refer to Note 2 for [Figure 21](#)).
- During power-down, the DMD's LPSDR input pins must be less than V_{DDI} , the specified limit shown in [Recommended Operating Conditions](#).
- During power-down, there is no requirement for the relative timing of V_{RESET} with respect to V_{OFFSET} and V_{BIAS} .
- Power supply slew rates during power-down are flexible, provided that the transient voltage levels follow the requirements listed previously and in [Figure 21](#).

9.3 Power Supply Sequencing Requirements

- (1) Refer to [Table 3](#) and [Figure 22](#) for critical power-up sequence delay requirements.
- (2) To prevent excess current, the supply voltage delta $|V_{BIAS} - V_{OFFSET}|$ must be less than specified in [Recommended Operating Conditions](#). OEMs may find that the most reliable way to ensure this is to power V_{OFFSET} prior to V_{BIAS} during power-up and to remove V_{BIAS} prior to V_{OFFSET} during power-down. Refer to [Table 3](#) and [Figure 22](#) for power-up delay requirements.
- (3) To prevent excess current, the supply voltage delta $|V_{BIAS} - V_{RESET}|$ must be less than the specified limit shown in [Recommended Operating Conditions](#).
- (4) When system power is interrupted, the DLPA2000/2005/3000 initiates hardware power-down that disables V_{BIAS} , V_{RESET} and V_{OFFSET} after the micromirror park sequence.
- (5) Drawing is not to scale and details are omitted for clarity.

Figure 21. Power Supply Sequencing Requirements (Power Up and Power Down)

Power Supply Sequencing Requirements (continued)

Table 3. Power-Up Sequence Delay Requirement

PARAMETER		MIN	MAX	UNIT
t_{DELAY}	Delay requirement from V_{OFFSET} power up to V_{BIAS} power up	2		ms
V_{OFFSET}	Supply voltage level at beginning of power-up sequence delay (see Figure 22)		6	V
V_{BIAS}	Supply voltage level at end of power-up sequence delay (see Figure 22)		6	V

Refer to Table 3 for V_{OFFSET} and V_{BIAS} supply voltage levels during power-up sequence delay.

Figure 22. Power-Up Sequence Delay Requirement

11 Device and Documentation Support

11.1 Device Support

11.1.1 Device Nomenclature

Figure 24. Part Number Description

11.1.2 Device Markings

The device marking includes the legible character string GHJJJK DLP230NPAFQP. GHJJJK is the lot trace code. DLP230NPAFQP is the device marking.

Figure 25. DMD Marking

11.2 Related Links

The table below lists quick access links. Categories include technical documents, support and community resources, tools and software, and quick access to sample or buy.

11.3 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

11.4 Trademarks

IntelliBright, E2E are trademarks of Texas Instruments.
DLP is a registered trademark of Texas Instruments.

11.5 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.6 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DLP230NPAFQP	ACTIVE	CLGA	FQP	54	140	RoHS & Green	Call TI	N / A for Pkg Type			Samples
XDLP230NPAFQP	ACTIVE	CLGA	FQP	54	100	TBD	Call TI	Call TI			Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

NOTES UNLESS OTHERWISE SPECIFIED:

- 1 DIE PARALLELISM TOLERANCE APPLIES TO DMD ACTIVE ARRAY ONLY.
- 2 ROTATION ANGLE OF DMD ACTIVE ARRAY IS A REFINEMENT OF THE LOCATION TOLERANCE AND HAS A MAXIMUM ALLOWED VALUE OF 0.6 DEGREES.
- 3 BOUNDARY MIRRORS SURROUNDING THE DMD ACTIVE ARRAY.
- 4 NOTCH DIMENSIONS ARE DEFINED BY UPPERMOST LAYERS OF CERAMIC, AS SHOWN IN SECTION A-A.
- 5 ENCAPSULANT TO BE CONTAINED WITHIN DIMENSIONS SHOWN IN VIEW C (SHEET 2). NO ENCAPSULANT IS ALLOWED ON TOP OF THE WINDOW.
- 6 ENCAPSULANT NOT TO EXCEED THE HEIGHT OF THE WINDOW.
- 7 DATUM B IS DEFINED BY A DIA. 2.5 PIN, WITH A FLAT ON THE SIDE FACING TOWARD THE CENTER OF THE ACTIVE ARRAY, AS SHOWN IN VIEW B (SHEET 2).
- 8 WHILE ONLY THE THREE DATUM A TARGET AREAS A1, A2, AND A3 ARE USED FOR MEASUREMENT, ALL 4 CORNERS SHOULD BE CONTACTED, INCLUDING E1, TO SUPPORT MECHANICAL LOADS.
